

5ο GYMNASIUM OF KARDITSA

Covid 19 People and Animals during the pandemic crisis.

Coronavirus SARS-CoV-2 COVID-19

From the first half of 2020, covid 19, spread out through almost all countries in the world

**Covid 19 has affected
both people and animals
alike around the world**

**It is very important that we all stay focused on
creating a healthy and sustainable world for
animals and humans**

Here we have some suggestions to help people during coronavirus pandemic

While many people don't have extra funds right now if you are one of the lucky ones who do, consider donating to an organization or to your community

People can donate clothes, food, medicines, supplies for hospitals, computers for schools and other useful materials for people with financial difficulties.

▮ **A very easy way to help people, friends, and relatives is to send them text or to make a video call.**

Start with those who might feel more vulnerable right now...

Practice social distancing and self care

- ◆ Don't underestimate how much you are helping by simply following public health guidelines.
- ▮ Even by just staying at home as much as you can and practicing social distancing when you do go out, you are making a vital difference by protecting you and the people around!

Animals: the voiceless victims of the Covid 19 crisis!

Unfortunately, there are many reports of companion animals starving or being killed as a result of the COVID-19 outbreak highlight the vulnerable existence animals endure at the whim of humans.

We can offer supplies and support

- ▮ Check with your local shelter or rescue to see how you can support them during this crisis. Your generosity will be gratefully accepted, particularly during this stressful time.**

Our message is:

Help Us Stay Prepared for
Emergency Situations

Animals Still Need You

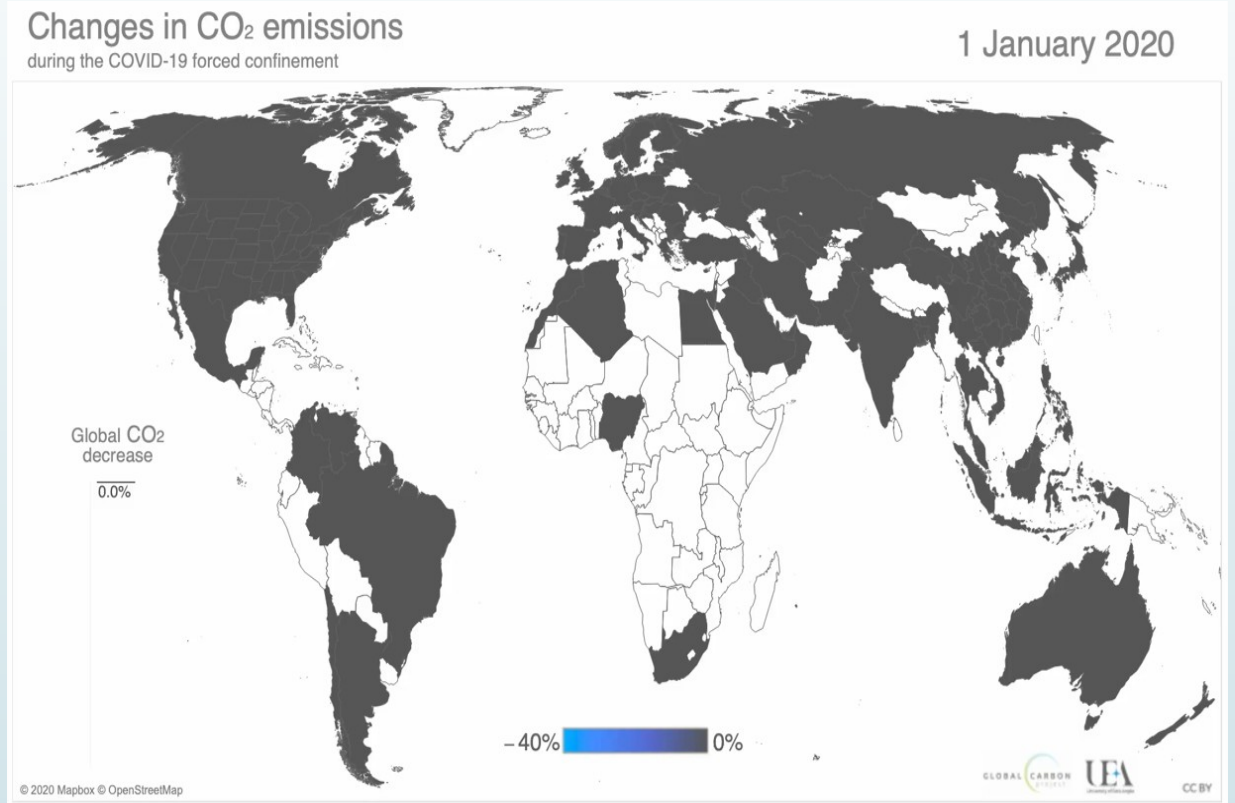

DONATE

In many countries thanks to generous donations people helped coordinate a weekly delivery of pet food to communities in need.

**Fortunately, there are and
some good news!**

**We can see the
changes in CO₂
emissions in
January 2020.
Our air is much
cleaner now!**

Water bodies have also been clearing and the rivers have seen significant improvement since the enforcement of a nationwide lockdown.

Unfortunately, this dip in carbon emissions will likely only last as long as the virus does

□ Scientist on lessons from the coronavirus pandemic we can apply to fight climate change with more permanently results
